                                                                                                                                                                                                                                                                                          맑
                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that down regulate the expression or inhibit the function of a receptor of or a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenssis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                         RESULT 1916
                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGDR), I kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g: melanoma, I ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The mucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cuberters sequence.

                                                                                                                                                                                                                                                                                                                                                                                                         that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PRGDR), is a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PRGDR), or protein kinase PRR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
Best Local (
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of carget RNA in a cell. The present RNA sequence represents a human PKR minister.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOSO, prostaglandin D2 receptor (PTGDR). IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CMS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-APR-2001; 2001US-00827395.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR).
IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenceis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-APR-2001; 2001US-00827395.

                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor (For a neurite growth inhibitor, NGG, prostaglandin D2 receptor (PTGDR), CC IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the convention are useful for treating: cerebrovascular accident, central convention are useful for treating: cerebrovascular accident, central convention are useful for treating: cerebrovascular accident, central conventions system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma) inflammatory disease (e.g. rheumatoid arthritis, conventions or asthma), Crohn's disease, diabetes, obesity, autoimmune conditions or asthma), Crohn's disease, diabetes, obesity, autoimmune conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The curleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the conditions of a target gene and as a diagnostic tool to examine genetic conditions are also useful for down-regulating the conditions are also useful for down-regulating 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NCGO, prostaglandin D2 receptor (PTGR),
C IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascullar accident, central
reryous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
c lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
c restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
c cichaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
c conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
c expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                for a neurite growth inhibitor, NOGO, prostaglanddin DZ receptor (PTGDR). IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR and accounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-APR-2001; 2001US-00827395.

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC forpas kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC restenosis or asthma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC current season of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC current season.
                                                                                                                                                                                                                                                                                                                                                                                   Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase oprotein kinase PKR genes, for treating cancer and inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       05-APR-2001; 2001US-00827395

                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), I KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, 1ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the capression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cubertars sequences.
                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that down regulate the expression or inhibit the function of a receptor (CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central carvous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, accidents, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, cc ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor (CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC (RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC (1ymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cuncleic acids of the invention are also useful for down-regulating the CC drifts and mutations within diseased cells or to detect the presence of a CC curverus screence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               'restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rej graft rejection; ischaemia; reperfusion; glomerulonephritis; allergy; asthma; allergic rhinitis; atopic dermatitis; human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    05-APR-2001; 2001US-00827395.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, cestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The muleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cushetrer segmence.
                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises nucleic acids (e.g. antisense oligonucleotides)
Ct that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lugus, multiple sclerosis, transplant/graft rejection, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC ucleic acids of the invention are also useful for down-regulating the CC nucleic acids of the invention are also useful for down-regulating the CC ucleic acids of the invention are also useful for down-regulating the CC target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                          that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), Independent of a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), Independent of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or acopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection, ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        05-APR-2001; 2001US-00827395.

The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC [RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerébrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC restenosis or asthma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cultifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR cultifulations of a target gale and as a diagnostic tool to examine genetic conditions (e.g. asthma, allergic RNA in a cell. The present RNA sequence represents a human PKR cultifulations within diseased cells or to detect the presence of a condition of the company of the cultifulation of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a trayet gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune disease; lupus; multiple sclerosis; transplant rejecti

that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR). I kappab kinase (IKK), or prottain kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR

                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                       RESULT 1936
ADL49434
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
(for a neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR),
(FappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
cerebrous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
(for invention are glioma), inflammatory disease (e.g. rheumatoid arthritis,
cerestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
(fiscase, lupus, multiple sclerosis, transplant/graft rejection,
cerebrousia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises nucleic acids (e.g. antisense oligonucleotides)

C that down regulate the expression or inhibit the function of a receptor

for a neurite growth inhibitor, NCGO, prostaglandin D2 receptor (PTGDR),

C IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

invention are useful for treating: cerebrovascular accident, central

c invention are useful for treating: cerebrovascular accident, central

c invention are useful for treating: cerebrovascular accident, central

c invention are useful for treating: cerebrovascular accident, central

c invention are useful for treating: cerebrovascular accident, central

c invention are glioma), inflammatory disease (e.g. rheumatoid arthritis,

c restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

disease, lupus, multiple sclerosis, transplant/graft rejection,

c disease, lupus, multiple sclerosis, transplant/graft rejection,

c disease, lupus, multiple sclerosis, transplant/graft rejection.

C conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

nucleic acids of the invention are also useful for down-regulating the

c expression of a target gene and as a diagnostic tool to examine genetic

c drifts and mutations within diseased cells or to detect the presence of a

c substrare service.
                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (for a neurite growth inhibitor, NGO, prostaglandin D2 receptor (PTGDR). (I kappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the cinvention are useful for treating: cerebrovascular accident, central convention are useful for treating: cerebrovascular accident, central convention are useful for treating: cerebrovascular accident, central conventions of the inflammatory disease (e.g. rheumatoid arthritis, conventions or asthma), Crohn's disease, diabetes, obesity, autoimmune conditions or asthma), Crohn's disease, diabetes, obesity, autoimmune conditions, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention are also useful for down-regulating the concleic acids of the invention and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises nucleic acids (e.g. antisense oligonucleotides) CC that down regulate the expression or inhibit the function of a receptor CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKX), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cutofic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC cutofic acids of a call. The present RNA sequence represents a human PKR combattage and as cell. The present RNA sequence represents a human PKR combattage and as cell.
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor (For a neurite growth inhibitor, NoGO, prostaglandin D2 receptor (PTGDR), CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the CC invention are useful for treating: cerebrovascular accident, central CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune CC disease, lupus, multiple sclerosis, transplant/graft rejection, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The CC cucleic acids of the invention are also useful for down-regulating the CC expression of a target gene and as a diagnostic tool to examine genetic CC drifts and mutations within diseased cells or to detect the presence of a CC categet RNA in a cell. The present RNA sequence represents a human PKR

Human neurodegenerative disease-related sequencing

primer

SeqID170.

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
[KappaB kinase (IKX), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
crestenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis,
crestenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-APR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel method of determining a predisposition for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uPA), gamma-synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSL1), lysosomal acid lipase (LIPA) and tumour necrosis factor receptor SF6 (TMFRSF6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzheimer's disease. The present sequence is that of a sequencing primer which was used for sequencing of a region of the human IDE gene in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04-DEC-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US2003224380-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining a predisposition for or the occurrence of neurodegenerative disease, particularly Alzheimer's disease, comprises determining the presence of a polymorphism in the uPA, SNCG, IDE, KNSL1, LIPA or TNFRSF6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Becker KD,

CC gene (I) in a first brain tissue sample (T) suspected of being CC enothelial markers (GEMS)) as given in specification, and comparing the CC endothelial markers (GEMS)) as given in specification, and comparing the CC expression of (I) in (T) with expression of (I) in second normal brain CC tissue sample (R), where increased expression of (I) in (T) relative to CC (R), identifies (T) as likely to be neoplastic. Also described: (I) CC treating (M2) glioma involves contacting cells of the glioma with an CC identifying (M3) a test compound as potential anticancer or antiglioma (I), monitoring an expression product of the at least one gene and CC (I), monitoring an expression product of the at least one gene and CC identifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (M4) a test compound with the cell which expresses (CC identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (A) inducting at test compound with the cell which expresses mRNA of at least one gene and CC identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (A) inducing (M5) an immune response to glioma involves administering to a mammal, a protein CC identifying the expression of at least one gene; and (A) inducing (M5) an CC identifying the expression of at least one gene; and (A) inducing (M5) an CC identifying in diagnosing glioma. (M2) is useful for treating multication of glioma or an amammal who has had a superior diagnosing glioma or in a mammal who has had can be gene inducers and immune response to a glioma in a mammal having glioma or in a mammal who has had can gene in invention. The present sequence represents a human GEM long tag oligonucleotide, which is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition which contains at least one vector (B) containing a nucleic acid (I) associated with breast cancer. The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II) specific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells; to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vector containing nucleic acid associated with breast cancer, useful treating, diagnosing and characterizing breast cancer, also related polypeptides and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                         The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying a subject at risk of breast cancer by detecting the or absence of one or more nucleotide polymorphic variations, use diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-NOV-2002;

                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHGB;secretogranin nucleotide polymorphisms within human chromogranin B (CHGB;secretogranin accordance).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast cancer; cytostatic; gene therapy; human; chromogranin secretogranin 1; SCG1; chromosome 20pter-p12; ss; PCR; primer

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHGB;secretogranin 1;SCG1) DNA which is located at chromosomal position 20pter-p12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                             breast cancer; cytostatic; gene therapy; human; platelet glycoprotein VI; GP6; GPIV; GPVI; chromosome 19q13.4; ss; PCR; primer; SNP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17 BP; 5 A; 6 C; 2 G; 4 T; 0 U; 0 Other;

Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a

6; Page 91; 227pp; English.

The present invention relates to a method for identifying a subject at risk of breast cancer. The method comprising detecting the presence or absence of one or more polymorphic variatations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DLG1 region (ADO79402), KIAAO783 region (ADO79403), DPF3 (ADO79404) ç (ADO79405). gene

```
CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The CC gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783 CC has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a CC novel gene with unknown function, however, being a zinc finger protein, CC it likely to be a transcription factor. The gene PF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 CC and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange CC factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The CC gene CENPC1 (centromere protein C1) is also known as Centromere CC autoantigen C1. CENPC1 has been mapped to chromosomal position 4q12-CC (finetochore plate. The CENPC1 protein is required for maintaining proper CC kinetochore plate. The CENPC1 protein is required for maintaining proper CC kinetochore size and a timely transition to anaphase. The method is CC useful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and CC predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1953

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC comprises the DLG1 region (ADO79402), KIAAO783 region (ADO79403), DPF3
CC region (ADO79404) or CENPC1 region (ADO79405). The gene DLG1 (discs, CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC 97, Adlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The CC gene KIAAO783 is also known as PHF14 and PHD finger protein 14. KIAAO783 (C novel gene with unknown function, however, being a zinc finger protein, is a CC novel gene with unknown function, however, being a zinc finger protein, CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 (C double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 (C gene CENPC1 (centromere protein C1) is also known as CERD4, cer-d4, FLJ14079 (C gene CENPC1 (centromere protein C1) is also known as Centromere (C gutoantigen C1. CENPC1 has been mapped to chromosomal position 14q24.3-q31.1. The CC useful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and CC predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

The nucleic acid sample comprises the DLG1 region (AD079402), KIAA0783 region (AD079403), DPF3 CC region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs, CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC gene KIAA0783 is also known as pHF14 and pHD finger protein 14. KIAA0783 (CC has been mapped to chromosomal position 7921.3. The KIAA0783 protein is a convel gene with unknown function, however, being a zinc finger protein, CC it likely to be a transcription factor. The gene DPF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CEED04, cer-d4, FLJ14079 (CC factor. DPF3 has been mapped to chromosomal position 14Q24.3-q31.1. The CENPC1 (centromere protein C1) is also known as Centromere (CC gene CENPC1 (centromere protein C1) is also known as Centromere (CC q13.3. CENPC1 has been mapped to chromosomal position 4q12-cc diagnosis, preplate. The CENPC1 protein is required for maintaining proper (kinetochore size and a timely transition to anaphase. The method is cuseful for identifying a subject at risk of breast cancer, for early cd diagnosis, prevention and treatment of breast cancer, to analyze and cc predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.

The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-447. The specific target sequence of this oligomer is the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neoplasia; mutant; target nucleotide; neck cancer; head cancer; saliva test, primer; PCR; amplification.
                                  This is an exemplary oligonucleotide primer, for use in the detection of neoplasmic related gene mutations. There are over 40 known protonocogenes and suppressor genes to date, which control growth, development, and cell differentiation. Regulation of these genes can, under certain circumstances, be altered and normal cells can assume neoplastic growth characteristics. The invention provides a method for detecting a neoplastic disorder of the head and neck or lung in a subject. The detection of a target mutant nucleotide sequence in the saliva is indicative of a neoplastic disorder of the head, neck or lung. This allows early detection and therefore treatment of the preneoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exemplary oligonucleotide primer D9S737 (Rev).

                                                                                                                                                                                       The present invention describes a method for identifying compounds which modulate the activity of epidermal growth factor-containing fibrillin like extracellular matrix protein 1 (BFEMP1). The human BFEMP1 coding and protein sequences are also provided. Compounds of the invention can be used in the treatment of macular degeneration and other diseases related to EFEMP1. The present sequence is a PCR primer for a fragment of the

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for reprotyping a nucleic acid sample by cc diagnatity of a SNP and for genotyping nucleic acid sample by cc diagnatity of a SNP and for genotyping nucleic acid samples, for e.g. to cligonucleotides are useful for determining the presence, absence or cc didnitity of a SNP and for genotyping nucleic acid samples, for e.g. to cligonucleotides aponotyping nucleic acid samples, for e.g. to cligonucleotides aponotyping primer extension reaction. The cc assess by association analysis the genotype of an individual or group of clidity duals, having a pathological phenotypic traits suspected of being cagemanglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial confisametion, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic confiscence in the present sequence represents a PCR primer specific for a termity analysis. The present sequence represents a PCR primer specific

                                                                                                                                                                                                                                                                             Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide cc primer extension (SNPB) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention cc includes kits for determining the presence of a SNP using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid sample by cc individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cc diseases include symptoms of or susceptibility to multifactorial diseases of which a component is or may be genetic such as autoimmune c inflamation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and cc for a human SNP containing DNA seminerce

The invention relates to an isolated nucleic acid (I) involved in growth CC regulation in human colonic epithelial cells, termed CATX. (I) is useful CC as a probe/primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis CC and treatment of abnormal cell growth (such as cervical cancer, and treatment of abnormal cell growth (such as cervical cancer, and cC lymphomas), in screening assays for the treatment of abnormal cell growth, for raising antibodies, and to screen for peptide analogues and CC growth, for raising antibodies, and to screen for peptide analogues and CC colon cancer cells, for generating probes and primers designed for CC colon cancer cells, for generating probes and primers designed for CC therapy, and in tissue profiling. (I) identifies cancer cells at an early cetterapy, and in tissue profiling. (I) identifies cancer cells at an early conditions prior to the total promability of the cancer cells can be identified prior CC conditions prior to spreading throughout the human body. (I) allows early detection CC conditions prior to spread of the cancer cells throughout the body, or CC prior to development of an irreversible cancerous condition. ABK27426-CC ABK27469 represent human colon cancer associated coding sequences and creatmers of the invention

Predicting a therapeutic response comprises comparing a first nucleic acid allele in an interleukin-10 (IL-10) regulatory region with a seconderic acid allele in the IL-10 regulatory region associated with a outcome a second

Claim 12; SEQ ID NO 4; 34pp; English

therapeutic response to the administration of interferon-alpha-2b and ribavirin for the treatment of a pathological condition, especially chepatitis C virus (HCV) infection. The method involves determining which allelic form is present at positions -3575, -2763, -1082, -819 and -592 of the interleukin-10 (IL-10) regulatory region, and comparing these with the allelic forms at these positions which are associated with a known outcome of interferon-alpha-2b and ribavirin administration. Presence of the single nucleotide polymorphisms -592A and -819T, the -592A/A or -819T/T genotypes, the combination of -592A and -819T, the -592A/A or -600 (108)TCATA haplotype (encompassing positions -3575, -2763, -1082, -600 (108)TCATA haplotype (encompassing positions -3575, -2763, -1082, -600 (108)TCATC haplotype indicates that the presence of -592C and -819C, or the (108)TCACC haplotype indicates that the patient will be non-The invention relates to a method for predicting an individual's

The invention also encompasses kits and oligonucleotide primers for use in the methods of the invention. The method and primers are useful for identifying and analysing genetic polymorphisms in the IL-10 regulatory region and/or cytotoxic T-lymphocyte antigen-4 which can be used in predicting an individual's response to therapeutic intervention with interferon-alpha-2b and ribavirin for HCV infection, and for predicting the responsiveness of an individual to therapy for a pathological condition, or for predicting the outcome of therapeutic intervention in pathological conditions such as bacterial infection (e.g. meningococcal infection), rheumatoid arthritis, systemic lupus erythematosus, Sjogren's syndrome, inflammatory bowel disease or multiple sclerosis. The present sequence is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; naemac,
gene therapy;
                          The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CDG which distinguishes between methylated and non-methylated CDG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haematopoietic cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16-JAN-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABZ10660 standard; DNA; 18
                                                                                                                                                                                                                                                                                 Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent tidistinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytosine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC represent specifically claimed nucleotide sequences from the present convention. Oligonucleotides from the present invention can be used: for CC disorder haematopoietic cells; for differentiating between healthy haematopoietic cells and proliferative CC disorder haematopoietic cells; for differentiating between acute CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC determining the cytosine methylation state and/or single nucleotide CC polymorphisms (SNPS) of haematopoietic cell proliferation disorder CC related sequences and their complements; and as primers for the CC amplification of haematopoietic cell proliferation disorder related DNA CC sequences. The nucleotide sequences from the present invention can also CC be used for detecting a predisposition to, differentiation between CC collasses, diagnosis, prognosis, treatment and/or monitoring of CC haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                             abnormality is an indication that the patient has an increased risk of the late-onset neurodegenerative disease. DAO is a flavin dinuclectide (FAD)-dependent oxidase which catalyses the oxidative deamination of D-amino acids (EC.1.4.3.3). The method of the invention has neuroprotective and antiparkinsonian applications and may be useful in determining an increased risk of a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease (AD), possibly via gene therapy. The current sequence is that of a PCR primer 2 of the invention which was used to amplify human D-amino acid oxidase exon 1 gDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                late-onset neurodegenerative disease; D-amino acid oxidase; DAO; Elavin dinucleotide; FAD-dependent oxidase; D-amino acid oxidative deamination; EC.1.4.3.3; neuroprotective; antiparkinsonian; amyotrophic lateral sclerosis; ALS; Parkinson' Alzheimer's; gene therapy; human; ss; PCR; primer; chromosome 12

The present invention describes using a leukotriene synthesis inhibitor (CC (I) for the manufacture of a medicament for the treatment of myocardial infarction or susceptibility to myocardial infarction in an individual. CC Also described is a method (MI) for the treatment of acute coronary CC syndrome (ACS) in an individual comprising administering (I). (I) has call the continuous continuous and antiatheroscierotic, cardiant and antianginal activities, and can be used as a leukotriene biosynthesis inhibitor, and a leukotriene receptor CC antagonist. (I) can be use for the manufacture of a medicament for the treatment of myocardial infarction or susceptibility to myocardial CC infarction in an individual who has at least one risk factor chosen from CC the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a CC (LO) gene promoter; in an individual who has at least one risk factor chosen from diabetes, hypertension, hypercholesterolaemia, elevated cohosen from diabetes, hypertension, hypercholesterolaemia, elevated

                                                                                       The present sequence is that of primer D12SDK1F which, with primer CC D12SDK1R AD043262, can be used to amplify D12SDK1, a novel microsatellite CC marker associated with bipolar affective disorder and genetically related CC unipolar affective disorder. D12SDK1 comprises a dinucleotide repeat. 8 CC Alleles (134-152 bp) have been detected. A locus for bipolar disorder and CC related unipolar affective disorders has been fine mapped on chromosome C1 (C12) for the first time and several genes that are carrying mutations increasing susceptibility to bipolar disorder have been identified. The C2 region is approximately 2 million base pairs of DNA in the chromosomal CC region 12g24.3 on the short arm of chromosome 12 between markers D1282705 CC and D12S340. The inventors genotyped 21 newly described and previously published microsatellite markers in a sample of 381 Danish and British CC bipolar patients and compared the frequency of marker alleles to a compared the regults, the invention provides marker alleles to a based on the results, the invention provides markers and methods of using them in diagnosing, or determining the susceptibility of an individual to, bipolar and genetically related unipolar affective disorders and creatment compounds for use as part of therapeutic and/or diagnostic methods. A method of treatment comprises administering a substance that modulates candardate gene or which modulates the level of activity of a candidate gene or which modulates the level of activity
                                                                    method of treatment comprises a expression of a candidate gene of a candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing, prognosing, or determining the susceptibility to, a neuropsychiatric disorder using a C12 candidate gene region marker by determining the structure, level of expression or activity of a polypeptide encoded by the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bipolar affective disorder; Unipolar affective disorder; diagnosis; marker; neuroleptic; gene therapy; PCR; primer; human; ss.

The invention involves detecting the presence or absence of one or more polymorphic variations associated with melanoma in the neuropilin 1 (NRP1) or mannose receptor C type 2 (MRP2) genes. The method of the invention is useful for identifying subjects at risk and treating melanoma. The present DNA sequence represents an extension PCR primer that was used to detect single nucleotide polymorphisms within human
